

1A.

---

B.

For the cost domain, we can assume that a book can be free of cost or cost according to its popularity in terms of currency \$.

So, base case 0.0 can up to lets say 999.99

Datatype: Decimal(5,2)

C.

Superkey : uniquely identifies the entity, can be null. Since we don't have any obvious Superkeys like StudentID for students, we can go for book titles for superkeys in our case.

{title}

{title, author}

{title, author, publisher}

{title, author, publisher, pubDate}

D.

CandidateKey:

Minimal super key: {title}

E.

Primary Key: could be easier if we have aBookID. as an attribute. But considering the

information that we have, we can say that title is the primary key. The book's attribute title is underlined in the diagram to show that it is a primary key. {title}

2.

A. The purchase can include many books and the same book can be purchased from different places. Since, it satisfies the one-to-many and many-to-one, the relation is many-to-many and shown in the diagram using crow's feet.

B.

A Purchase can contain multiple Books.

Every Purchase must contain at least one Book.

A Book may or may not be part of a purchase.

A Book can be included in multiple Purchases for eg different sellers.

C.
